Functional and logic programming - written exam -

Important:

- 1. Subjects are graded as follows: of 1p; A 1.5p; B 2.5p; C 2.5p; D 2.5p.
- 2. Prolog problems will be resolved using SWI Prolog. The following are required: (1) explanation of the code and of the reasoning behind it; (2) recursive model that solves the problem, for all the predicates used; (3) specification of every predicate (parameters and their meaning, flow model, type of the predicate deterministic/non-deterministic).
- 3. Lisp problems will be resolved using Common Lisp. The following are required: (1) explanation of the code and of the reasoning behind it; (2) recursive model that solves the problem, for each function used; (3) specification of every function (parameters and their meaning).
- **A.** Given the following PROLOG predicate definition **f(integer, integer)**, with the flow model (i, o):

```
f(1, 1):-!.

f(K,X):-K1 is K-1, \underline{f(K1,Y)}, Y>1, !, K2 is K1-1, X is K2.

f(K,X):-K1 is K-1, \underline{f(K1,Y)}, Y>0.5, !, X is Y.

f(K,X):-K1 is K-1, \underline{f(K1,Y)}, X is Y-1.
```

Rewrite the definition in order to avoid the recursive call **f(J,V)** in all clauses. Do NOT redefine the predicate. Justify your answer.

B. Given a nonlinear list that contains both numerical and non-numerical atoms, write a Lisp program that builds a list that contains only numerical atoms, alternatively containing even and odd numbers. Odd numbers are each in a sublist. The even and odd numbers are in the same order relatively to the initial list. We assume that the initial list contains the same number of even and odd numbers. For example, for the list (A B (4 A 2) 11 (5 (A (B 20) C 10) (1(2(3(4)5)6)7 7) X Y Z)) the result will be (4 (11) 2 (5) 20 (1) 10 (3) 2 (5) 4 (7) 6 (7)).

C. For a given value N, generate the list of all permutations with elements N, N+1, ..., 2*N-1 with the property that the absolute value between two consecutive values from the permutation is <=2. Write the mathematical models and flow models for the predicates used.

- **D.** Given a nonlinear list, write a Lisp function to return the list with all occurrences of the element **e** replaced by the value **e1**. **A MAP function shall be used.**
- **Example** a) if the list is (1 (2 A (3 A)) (A)), e is A and e1 is B => (1 (2 B (3 B)) (B))
 - **b)** if the list is (1 (2 (3))) and **e** is A = (1 (2 (3)))
